

## ***Strengths and Weaknesses of the game you have developed:***

### Strengths:

#### **System Division**

At the very beginning the programmers divided up all the different systems within the game between us. This allowed people to know what they needed to work on, and who other people needed to ask if there was a problem. It meant that people didn't accidentally work on the same code. Keep the files clear and help prevent merge conflicts because there wasn't much class over laps.

#### **Organisation**

We made sure to keep our godot files organised by having clear and understandable folder names. This allowed for easy access and the ability to easily find things within the project folder when we needed to.

#### **Multiplayer system**

A strength of our game is the multiplayer aspect, it creates a fun, competitive, replayability aspect to our game that makes it stand out. The inclusion of it has meant as a team we've all had to learn about networking (some more than others) and that is a valuable skill to take with us after this project.

### Weaknesses:

#### **Networking**

While the networking aspect of our game created a bit of a challenge for us. While we were always intending to add multiplayer to our game the code for it wasn't added in until a few weeks in, which is fine. However unfortunately this caused us to then have to go back through the code we'd already done and rework it to fit networking. It was worth it but set us back a bit and has caused small bugs here or there throughout the entire process.

#### **Skill Level**

The game has lots of controls within it, the player has the ability to interact with a lot of different things sometimes using the same keys. This is a weakness because it may make it hard for new players to quickly learn the controls. It could cause cognitive confusion when trying to remember what to do when. Overall the controls come together to create a rewarding system but it is a learning curve that might prevent people from continuing with our game and not getting to enjoy it fully.

## ***Discussion of best parts of the game/ development process as a group***

The communication we had as a group was really good, being able to discuss bugs or improvements that could be made in a respective and effective manner. This allowed for a really smooth process that encouraged group collaboration to its fullest.

The programmers had a meeting at the start of the project to discuss what we each wanted to do, how we thought things could be done and what we expected from this project. We then had another one about halfway through the project process to do a code review and

touch base. This was really good and helped make sure all the programmers were on the same page.

Weekly in-person meetings on Wednesday were really effective, allowed for a little catch up on how people were doing and created a space for us to work together on solutions if anyone had problems. A weekly online meeting on Sunday for the programmers also allowed for this.

Getting to see this game slowly form over the weeks was pretty cool. It was nice to pull everyone else's work each Wednesday and get to play around with what they'd done. It was rewarding to finally get key components of the game working and move onto the next thing.
